2. Comparison of test results

1 | Suitability of continuous printing

- Test Conditions : We count the number of total heads cleaning during printing total 400pages (100pages each color)
The fewer number of head cleans indicates that the inks have a better inks stream and excellent printing quality during the long print runs.

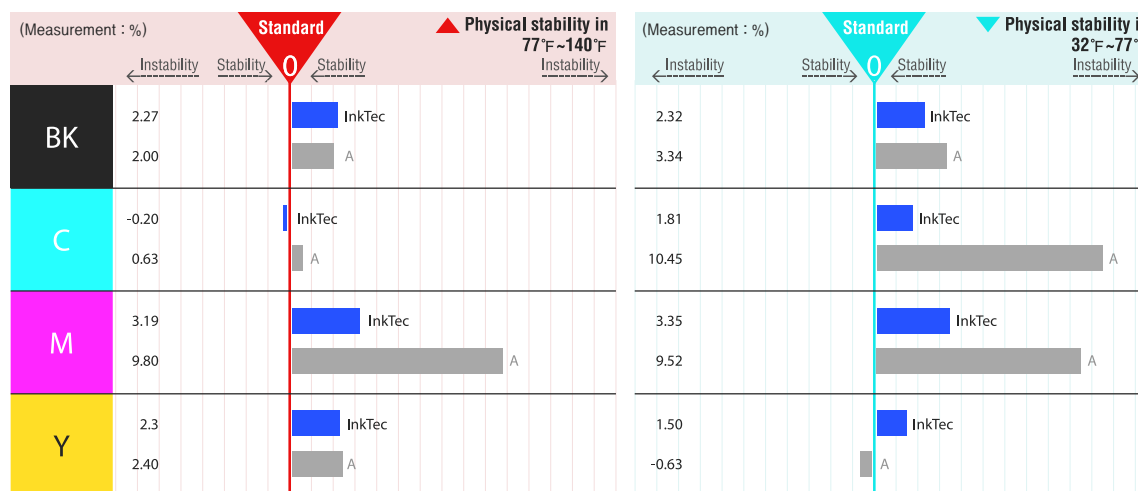

2 | Jetting suitability after 3 days without use

- Test Conditions : The number of total head cleans during the printing of 80 pages continuously (20 pages each color) after the printer has been switched off for 3 days.
The fewer number of head cleans indicates that the inks have a better inks stream and excellent print quality, even if the printer has not been used recently.

3 | Physical stability in extreme temperatures

Inkjet inks are sensitive to changes in temperature and humidity. High (Low) temperature makes the ink-viscosity lower (higher) than that was initially designed. These changes leads to deterioration in product quality. Therefore, these tests of endurance at high (low) temperature enviroment are a very important factor in determining the ink's quality.

If the figures above in the table are close to 0%, the inks ensure stable inks stream and excellent print quality in extreme environments. InkTec inks ensure optimum print quality in external environmental stimuli.

4 | Color Gamut
